

PHAN NGUYEN QUOC MINH

FRESHER FULL-STACK ENGINEER

CONTACT

- +84 767348675
- minhpnq1807@gmail.com
- Da Nang, Vietnam
- github.com/khovan123

TECHNICAL SKILL

- Backend:** TypeScript, NodeJS, NestJS, ExpressJS, RESTful API, WebSocket, RabbitMQ, FastAPI.
- Frontend:** ReactJS, NextJS, Micro Frontend, State Management Optimization.
- Architecture:** Microservices,DDD, Clean Architecture, Design Patterns, OOP.
- Database & Cache:** TypeORM, Prisma, PostgreSQL, MongoDB, Redis.
- Security:** JWT, OAuth2, RBAC, PBAC, Auth guards.
- DevOps and Tools:** Docker, GitLab CI/CD, GitHub Action, Microsoft Azure, Jira, Agile/Scrum
- AI / ML & Tooling:** TensorFlow, Keras, FAISS vector search, MCP, RAG, NPM Package

SOFT SKILL

- Analytical & Debugging Mindset
- Fast Learner & Highly Adaptable
- System Design Thinking
- Code Review & Version Control
- Performance Optimization
- Technical Leadership

LANGUAGES

- English – B2

AWARD

- Third Prize
RES-START Startup Competition
FPT University, 2025

PROFILE

Full-Stack Engineer with production experience building scalable microservices and AI-powered applications. Specialized in Node.js/NestJS, Next.js, and TypeScript, with a strong track record in distributed system design, performance optimization, and technical leadership. Passionate about clean architecture, developer tooling, and emerging AI/ML technologies

WORK EXPERIENCE

Buddy

3/2026 - 6/2-2026

Full-Stack Engineer | [platform-buddy.vercel.app](#)

- Architected a production-grade distributed learning marketplace from scratch with 11 independently deployable NestJS and FASTAPI microservices; built a resilient API gateway with bulkhead, circuit breaker, and exponential-backoff retry patterns for partial-failure isolation across services.
- Engineered a Two-Tower TensorFlow/Keras recommendation service (FAISS nearest-neighbor indexing, drift monitoring, automated retraining triggers) and a separate RAG study assistant service (Sentence Transformers → Qdrant retrieval → Gemini generation → Redis cache) with real-time streaming UI and source citations.
- Built an HLS media pipeline (FFmpeg transcoding, auto trailer extraction, Supabase S3 presigned URLs) and a RabbitMQ event-driven system coordinating async cross-service workflows – payments, notifications, ML retraining triggers – alongside BullMQ background workers for media processing.
- Set up full observability stack (OpenTelemetry / Prometheus / Grafana / Jaeger) and path-based GitHub Actions CI/CD → Azure Container Registry → Azure Container Apps (backend) + Vercel (frontend), rebuilding only changed services on each push.

ContextOS – Open Source Side Project

2026 – Present

Author & Maintainer

[github.com/khovan123/contextOS](#) | [npmjs.com/@minhpnq1807/contextos](#)

- Built and published ContextOS (@minhpnq1807/contextos, 8 releases) – a Codex AI agent companion CLI that hooks into Codex lifecycle events to inject task-relevant AGENTS.md context via a local RAG pipeline: MiniLM-L6-v2 embeddings, FAISS file-path vector search, and import-graph traversal, all offline at sub-80ms latency.
- Architected a long-running ctx-mcp MCP server communicating with hook scripts via Unix socket bridge (zero cold-start); built a transparent stdio MCP telemetry proxy to capture tool-call compliance evidence without modifying upstream servers. Adopted by external users across open-source Codex projects.

Sharex Portal – FPT Software DN (Fresher)

08/2025 - 01/2026

Full-Stack Engineer

- Developed enterprise-level features using Spring Boot (backend) and ReactJS (frontend), contributing across requirement analysis, integration, and QA testing phases.
- Participated in integration testing and defect resolution, gaining experience in large-scale enterprise development workflows and cross-team communication.

EDUCATION

FPT UNIVERSITY (2026)
Bachelor of Software Engineering
GPA: 3.6 / 4.0
